Subschild Location: Secreted.
TISSUB SPECIFICITY: FOUND IN STORACH; IS ALSO EXPRESSED IN BREAST CANCER BUT NOT IN NORMAL TISSUE. IT IS REGULATED BY ESTROGEN IN MCF-7 CELLS. STRONG EXPRESSION FOUND IN NORMAL GASTRIC MUCOSA AND IN THE RECENERALIVE TISSUES SURROUNDING ULCEROUS LESIONS OF GASTROINTESTINAL TRACT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gastroenterology 119:691-698(2000).
-1- FUNCIION: Stabilizer of the mucous gel overlying the
gastrointestinal mucosa that provides a physical barrier against

                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                   The present sequence is human LK8 protein which contains the amino acid sequence of human apolipoprotein(a) kringle domain V38 (KV38). The human apolipoprotein(a) kringle domains LY36 (LK6 protein), IV37 (KW protein) and V38 (LK6 protein) together form the angiogenesis inhibitor. LK68 protein. LK68, LK6, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo choricallantoin membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating angiogenesis-mediated diseases, such as cancer, rheumatoid arthritis, psoriasis or ocular angiogenic also for inhibiting primary tumour growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Angiogenesis inhibitor; KED; kringle protein, angiogenesis; tPA; tissue plasminogen activator; tumour; atherosclerosis; arthritis; retinopathy; bronchial vascular congestion; inflammatory bowel disease; adult respiratory distrass syndrome; Castleman's disease; psoriasis; hepatitis; aneurysm; renal disease; haemangioma.
        Novel angiogenesis inhibitor, LK68 for treating angiogenesis-mediated diseases, e.g. cancer and rheumatoid arthritis, has human apolipoprotein(a) kringle domains IV36, IV37 and V38 amino acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is an isolated fragment of the Kringle 5 peptide corresponding to amino acid 462 of the human plasminogen protein which act be used in a novel method to inhibit endothelial cell proliferation activity. The protein can be used to treat angiogenesis mediated diseases, e.g. haemangiona, solid tumours, leukaemia, metastasis, telangiectasia, psoriasis, scleroderma, pyogenic granuloma, myocardial angiogenesis, plaque necyascularisation, coronary or cerebral
                                                  The specification describes a human polypeptide which is a potent angiogenesis inhibitor, and is designated KED. KED polypeptide, Kringle proteins, or a kringle derived from human tissue plasminogen activator (tPA) protein are used to inhibit angiogenesis. Kringle protein, KED or tPA are useful for treating tumours, as well as atherosclerosis, arthritis, retinopathy and other similar diseases. KED is also useful for the treatment of diseases such as bronchial vascular congestion, inflammatory bowel disease, adult respiratory distress syndrome, castleman's disease, psoriasis, hepatilis, aneurysm, renal disease and haemangioma. The present sequence represents kringle 5 of human plasminogen, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 EQDCMFGNGKGYRGKKATTVTGTPCQEWAAQEPHRHSTFIPGTNKWAGLEKNYCRNPDGD

The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 2, kringle 3, kringle 2-3, kringle 1-3, kringle 1-2, kringle 1-4 or kringle 1-4BKLS protein. The aggregate anglostatin has a Mol. Wto 45-65 kD and is derived from a plasminogen fragment beginning at approximately amino acid number 98 of murine, human, Rhesus, porcine or bovine plasminogen. The active component can be used for treating anglogenesis-mediated diseases such as cancer, arthritis, macular
                                                             wound
         corneal diseases, rubeosis, neovascular glaucoma, diabetic retinogathy, retrolental fibroplasia, arthritis, diabetic neovascularisation, muscular degeneration, peptic ulcer, Helicobacter related disease, fractures, keloids, vasculogenesis, hematopoiesis, ovulation, menstruation, placentation or cat scratch fever, and to stimulate wound healing. The protein and antibodies generated from it can be used to green for agonists and antagonists or in detection, imaging and

The invention relates to new methods and compositions for inhibiting endothelial cell proliferation, using as active component an angiostatin fragment, a combination of angiostatin fragment, or aggregate angiostatin. The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 2, kringle 3, kringle 1, kringle 1-3, kringle 1-3, kringle 1-3, kringle 1-4, kringle 1-3, kringl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ä

                                            antibodies for use in diagnosis, detection and therapy. The present sequence, Rhosus Kringle 1, is a specific angiostatin fragment which can be used in the invention, and represents amino acids 6-84 of Rhesus angiostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides fragments of kringle 1, 2 or 4 of human plasminogen that contain a lysine binding site and have anti-angiogenic activity. The peptides of the invention function as antiangiogenic activity. The peptides of the invention function as antiangiogenic agents, for the treatment process and diseases involving angiogenesis. Such diseases include cancers such as solid tumours, blood born tumours such as leukemias, tumours metastasis, benign tumours such as hemangiomas, acoustic acurcomas, neurofibromas, trachomas and pyogenic granulomas, rheumatoid arthritis, ocular angiogenic diseases such as diabetic retinopathy, retinopathy of prematurity, mecular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber syndrome, myocardial angiogenesis, plaque corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, and wound granulation, The fragments are also useful in treatment of disease of excessive or abnormal stimulation of endothelial cells. These

The DNA is used to construct a modified plasminogen activator (mPA) of greater fibrin selectivity than normal PA. The mPA is used in the treatment of pulmonary embolism, thrombosis, myocardial infarct and strokes.

inhibiting endothabilar call proliferation, using as active component an angiostatin fragment, a combination of angiostatin fragments, or aggregate angiostatin. The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 2, kringle 3, kringle 2-3, kringle 1-3, kringle 1-2, kringle 1-4 or kringle 1-4 bRKLS protein The aggregate angiostatin has a Mol. Wt. of 45-65 kD and is derived from a plasminogen fragment beginning at approximately amino acid number 98 of murine, human, Rhesus, porcine or bovine plasminogen. The active component can be used for treating angiogenesis-mediated diseases such as cancer, arthritis, macular degeneration and diabetic retinopathy. It can also be used to develop

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g., haemangiomas, Osler-Webber Syndrome), diseases caused by excessive or abnormal stimulation of endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta.

Sequences Aababa906-B01919 sepresent fragments of human plasminogen used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                        Plasminogen; human; kringle domain; endothelial cell proliferation; angiogenesis; antiproliferative; antiarteriosclerotic; cytostatic; antinflammatory; antiuloer; antirheumatic; antiarthritic; antiangiogenic; cancer; tumour; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of anglogenesis and endothelial cell proliferation and migration. The peptides are useful for treating anglogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: This sequence is not shown in the specification, but is derived from the full length human plasminogen sequence (AAB01887) shown in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1; Gaps

The specification describes a human polypeptide which is a potent angiogenesis inhibitor, and is designated KBD. KED polypeptide, kringle proteins, or a kringle derived from human tissue plasminogen activator (tPA) protein are used to inhibit angiogenesis. Kringle protein, KED or tPA are useful for treating tumours, as well as atherosclerosis, arthirits, retinopathy and other similar diseases. KED is also useful for the treatment of diseases such as bronchial vascular congestion, inflammatory bowel disease, adult respiratory distress syndrome, Castleman's disease, psorhasis, hepetifits, ameurysm, renal disease and haemangioma. The present sequence represents kringle I of human plasminogen, which is used in the course of the invention.
                                                                                                    Angiogenesis inhibitor; KED; kringle protein; angiogenesis; tPA; tissue plasminogen activator; tumour; atherosclerosis; arthritis; retinopathy; bronchial vascular congestion; inflammatory bowel disease; adult respiratory distrass syndrome; Castleman's disease; psoriasis; hepatitis; aneurysm; renal disease; haemangioma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3 DCMFGNGKGYRGKKATTVTGTPCQEWAAQEPHRHSTFIPGTNKWAGLEKNYCRNPDGDIN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                              The kringle K1 domain (AAR96221) of plasminogen was incorporated into tissue plasminogen activator (tPA) (see also AAR96220) as a replacement for the native tPA kringle 1 sequence, producing a novel plasminogen activator (see also AAR96222). This was performed by insertion of plasminogen K1 DNA (AAR27786) into a native tPA sequence (AAF27585) and expression in Escherichia coli RRI transformants (FERM P-9272). Such protocols can be used to produce novel plasminogen activators that show increased clot lysing specificity or plasma half-life. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1;

                                                                                                                                                                                                                                                                                        1 CKTGDGKNYRGIMSKTKNGITCQKWSSTSPHR-PRFSPATHPSEGLEENYCRNPDNDPG 59
                                                                                                                                    Amino acid sequence of kringle domain of plasminogen, incorporated into plasmid PKI. Sequence is derived from II synthetic oligonuclectides. Alternatively the sequence is described as encoding Asn at position 96. (Updated on 01-JUL-2002 to add missing PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to new methods and compositions for inhibiting endothelial cell proliferation, using as active component an angiostatin fragment, a combination of angiostatin fragments, or aggregate angiostatin. The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1,
                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   angiostatin; plasminogen; kringle; angiogenesis; cancer; arthritis; macular degeneration; diabetic retinopathy.

kringle 2, kringle 3, kringle 2-3, kringle 1-3, kringle 1-2, kringle 1-4 or kringle 1-4BKLS protein. The aggregate angiostatin has a Mol. Wt. of 45-65 kD and is derived from a plasminogen fragment beginning at approximately amino acid number 98 of murine, human, Rhesus, porcine or bovine plasminogen. The active component can be used for treating angiogenesis:mediated diseases such as cancer, arthritis, macular degeneration and diabetic retinopathy. It can also be used to develop antibodies for use in diagnosis, detection and therapy. The present sequence, porcine Kringle 1, is a specific angiostatin acids 6-84 of porcine angiostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             63

Sequence 6, Application US/08763528A

Patent No. 5854221
GENERAL INFORMATION:
APPLICANT: FOLKman, M. Judah
TITLE OF INVENTION: Endothelial Cell Proliferation Inhibitor
TITLE OF INVENTION: and Method of Use
NUMBER OF SEQUENCES: 6
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                             MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERALING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/763,528A
FILING DATE: 12-DSC-1996
CLASSIFICATION: 530
                                                                                                                                                                          SSEE: Jones & Askew, LLP

-!-TISSUE SPECIFICITY: Expressed by the venom duct.
-!-SIMILARITY: BELONGS TO THE O-SUPERFAMILY OF CONOTOXINS. OMEGA-TYPE
                                                                                                                                                                                             Peptides 20:1139-1144(1999).
-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC) (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -I-FUNCTION: Binds to sodium channels and inhibits the inactivation of the activated channels, thereby blocking neuronal transmission.
-I-SUBCRIFULIAR INCORTION: Secreted.
-I-TISSUE SPECIFICITY: EXPRESSED by the venom gland.
-I-SINIBARITY: BELONGS TO THE ALPHA/BETA-SCORPION TOXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Androctonus mauretanicus mauretanicus (Scorpion).

Arbitragan K.N., Nitthanan S., Sasaki T., Sato K., Cheng B., Srinivasan K.N., Nitthanan S., Sasaki T., Sato K., Cheng B., Srinivasan K.N., Nitthanan S., Sasaki T., Sato K., Cheng B., Srinivasan K.N., Nithanan S., Sasaki T., Sato K., Cheng B., Studional Site of bulkatoxin, an alpha-type sodium channel of the (52) Pukrotion, an alpha-type sodium channel of the (52) Pukrotion (Buthus martensi Karsch) venom: Translet. 494:145-149(2001).

1. FUNCTION: Binds to sodium channels and inhibits the inactivation of the activated channels, thereby blocking neuronal transmission.

1. SUNCTION: Binds to sodium channels and inhibits the inactivation of the activated channels, thereby blocking neuronal transmission.

1. SUNCTION: Binds to sodium channels and inhibits the inactivation.

2. SUNCTION: Binds to sodium channels and inhibits the inactivation.

2. SINITARITY: BELONGS TO THE ALPHA/BETA-SCORPION TOXIN FAMILY.

3. ALPHA-TOXIN SUBFAMILY.

-!- FUNCTION: Binds to sodium channels and inhibits the inactivation of the activated channels, thereby blocking neuronal transmission. This toxin is active against mammals (By similarity).

-!- FUSCHE SPECIFICITY: Expressed by the venom gland.

-!- SIMILARITY: BELONGS.

-!- SIMILARITY: PELONGS.

-!- SIMILARITY: PELONGS.

Submitted (JUL-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Binds to sodium channels and inhibits the inactivation of the activated channels, thereby blocking neuronal transmission.
This toxin is active against mammals (By similarity).
-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pfam, PF00537; toxin_3; 1.
